(54) Title: 3-CYANOQUINOLINES AS INHIBITORS OF EGF-R AND HER2 KINASES

(57) Abstract: This invention provides compounds of Formula (I), represented by the structure wherein G<sub>1</sub>, G<sub>2</sub>, G<sub>3</sub>, G<sub>4</sub>, Z, X and n are defined herein, or a pharmaceutically acceptable salt thereof which are useful as antineoplastic agents and in the treatment of polycystic kidney disease.

**3-CYANOQUINOLINES AS INHIBITORS OF EGF-R AND HER2 KINASES****FIELD OF THE INVENTION**

5

This invention relates to certain substituted 3-cyanoquinoline compounds as well as the pharmaceutically acceptable salts thereof. The compounds of the present invention inhibit the action of certain growth factor receptor protein tyrosine kinases (PTK) and other protein kinases thereby inhibiting the abnormal growth of certain cell types. The compounds of this invention are therefore useful for the treatment of certain diseases that are the result of deregulation of these PTKs. The compounds of this invention are anti-cancer agents and are useful for the treatment of cancer in mammals. In addition, the compounds of this invention are useful for the treatment of polycystic kidney disease in mammals. This invention also relates to the manufacture of said 3-cyanoquinolines, their use for the treatment of cancer and polycystic kidney disease, and the pharmaceutical preparations containing them.

10  
15**BACKGROUND OF THE INVENTION**

20

Protein tyrosine kinases are a class of enzymes that catalyze the transfer of a phosphate group from ATP to a tyrosine residue located on a protein substrate. Protein tyrosine kinases clearly play a role in normal cell growth. Many of the growth factor receptor proteins function as tyrosine kinases and it is by this process that they effect signaling. The interaction of growth factors with these receptors is a necessary event in normal regulation of cell growth. However, under certain conditions, as a result of either mutation or overexpression, these receptors can become deregulated. The result of this is uncontrolled cell proliferation which can lead to tumor growth and ultimately to the disease known as cancer [Wilks A.F., *Adv. Cancer Res.*, 60, 43 (1993) and Parsons, J.T.; Parsons, S.J., *Important Advances in Oncology*, DeVita V.T. Ed., J.B. Lippincott Co., Phila., 3 (1993) ]. Among the growth factor receptor kinases and their proto-oncogenes that have been identified and which are targets of the compounds of this invention are the epidermal growth factor receptor kinase (EGF-R kinase, the protein product of the erbB oncogene), and the product produced

25  
30

by the Her2 (also referred to as the *neu* or *erbB-2*) oncogene. Since the phosphorylation event is a necessary signal for cell division to occur and since overexpressed or mutated kinases have been associated with cancer, an inhibitor of this event, a protein tyrosine kinase inhibitor, will have therapeutic value for the treatment of cancer and other diseases characterized by uncontrolled or abnormal cell growth. For example, overexpression of the receptor kinase product of the Her2 oncogene has been associated with human breast and ovarian cancers [Slamon, D. J., et. al., *Science*, 244, 707 (1989) and *Science*, 235, 1146 (1987)]. Deregulation of EGF-R kinase has been associated with epidermoid tumors [Reiss, M., et. al., *Cancer Res.*, 51, 6254 (1991)], breast tumors [Macias, A., et. al., *Anticancer Res.*, 7, 459 (1987)], and tumors involving other major organs [Gullick, W.J., *Brit. Med. Bull.*, 47, 87 (1991)]. Because of the importance of the role played by deregulated receptor kinases in the pathogenesis of cancer, many recent studies have dealt with the development of specific PTK inhibitors as potential anti-cancer therapeutic agents [some recent reviews: Burke, T.R., *Drugs Future*, 17, 119 (1992) and Chang, C.J.; Geahlen, R.L., *J. Nat. Prod.*, 55, 1529 (1992)]. The compounds of this invention inhibit the kinase activity of EGF-R and Her2 and are therefore useful for treating certain disease states, such as cancer, that result, at least in part, from deregulation of these receptors. The compounds of this invention are also useful for the treatment and prevention of certain pre-cancerous conditions, such as the growth of colon polyps, that result, at least in part, from deregulation of these receptors.

It is also known that deregulation of EGF receptors is a factor in the growth of epithelial cysts in the disease described as polycystic kidney disease [Du J., Wilson P. D., *Amer. J. Physiol.*, 269(2 Pt 1), 487 (1995); Nauta, J., et al., *Pediatric Research*, 37(6), 755 (1995); Gattone, V.H., et al., *Developmental. Biology*, 169(2), 504 (1995); Wilson, P.D., et al., *Eur. J. Cell Biol.*, 61(1), 131, (1993)]. The compounds of this invention, which inhibit the catalytic function of the EGF receptors, are consequently useful for the treatment of this disease.

Some 3-cyanoquinoline derivatives are inhibitors of tyrosine kinases and are described in the application WO9843960 (US 6,002,008). These 3-cyanoquinolines may be substituted at carbon-5 through carbon-8 with an unsubstituted phenyl, alkene or alkyne group. Applications WO0018761 and WO0018740 also describe 3-cyanoquinoline inhibitors. A 3-cyanoquinoline with a 4-(2-methylanilino) substituent

having gastric (H<sup>+</sup>/K<sup>+</sup>)-ATPase inhibitory activity at high concentrations has been described [Ife, R., *J. Med. Chem.*, 35(18), 3413 (1992)].

The compounds of the present invention are 3-cyanoquinolines which inhibit the activity of protein kinases that are required for cell growth and differentiation and are therefore useful for the treatment of certain diseases that result from activity of these protein kinases. In particular, the compounds of this invention inhibit the kinase activity of EGF-R and Her2 kinases. The compounds of this invention are anti-cancer agents and are useful for the treatment of cancer in mammals. Further, the compounds of this invention are useful for the treatment of polycystic kidney disease in mammals.

10 Reactions are performed in a solvent appropriate to the reagents and materials employed and suitable for the transformation being effected. It is understood by those skilled in the art of organic synthesis that the various functionalities present on the molecule must be consistent with the chemical transformations proposed. This may necessitate judgement as to the order of synthetic steps. Appropriate  
15 consideration must be made as to the protection of reactive functional groups to prevent undesired side reactions.

Substituents on the starting materials may be incompatible with some of the reaction conditions. Such restrictions to the substituents which are compatible with the reaction conditions will be apparent to one skilled in the art. Reactions were run  
20 under inert atmospheres where appropriate.

The preparation of the compounds of this invention encompassed by formulas 2 and 4 is illustrated below in Flowsheet 1 where Z, X, n, R<sub>3</sub>, R<sub>4</sub>, G<sub>1</sub>, G<sub>2</sub>, G<sub>3</sub>, and G<sub>4</sub> are as described above. Treatment of the unsaturated amide of formula 1 or 2 with an

In some case where

the compounds 1 or 3 already contain a basic functional group, it may not be necessary to add an additional basic catalyst to obtain the compounds of this invention 2 and 4, respectively. In those cases where the product contains more than one asymmetric carbon atom, the resulting diastereomers can be separated by  
5 chromatographic methods.

As used in accordance with this invention, neoplasm and tumor are used interchangeably and mean an abnormal growth of tissue serving no physiological 10 function.

As used in accordance with this invention, the term providing an effective amount of a compound means either directly administering such compound, or administering a prodrug, derivative, or analog which will form an effective amount of the compound within the body.

15 In addition to the above utilities some of the compounds of this invention are useful for the preparation of other compounds of this invention.

30

A 1.7 kb cDNA encoding human HER2 cytoplasmic domain (HER2-CD, amino acid 676-1255) and 1.6 kb cDNA for EGFR cytoplasmic domain (EGFR-CD,

amino acid 645-1186) were cloned into baculoviral expression vectors, pBlueBacHis2B (Invitrogen) and pFASTBacHTc (GIBCO), separately. A sequence encoding (His)<sub>6</sub> is located at the 5' end upstream to HER2 and EGFR sequences. Sf-9 cells were infected at moi=10 for 3 days for protein expression. Sf-9 cell pellets were solubilized on ice in buffer containing 50 mM HEPES, pH 7.4, 10 mM NaCl, 1% Triton, 10  $\mu$ M ammonium molybdate, 100  $\mu$ M sodium vanadate, 10  $\mu$ g/ml aprotinin, 10  $\mu$ g/ml leupeptin, 10  $\mu$ g/ml pepstatin, and 16  $\mu$ g/ml benzamidine HCl for 20 min followed by 20 min centrifugation. Crude extract supernatant was passed through equilibrated Ni-NTA superflow packed column (Qiagen, Valencia, CA) and wash with 10 mM, and 100 mM imidazole to remove unspecific binding. Histidine-tagged proteins were eluted with 250 mM and 500 mM imidazole and dialyzed against 50 mM NaCl, 20 mM HEPES, 10% glycerol and 1  $\mu$ g/ml each of aprotinin, leupeptin and pepstatin for 2 h. All the purification procedure was performed at 4C° or on ice. Purified materials were subjected for electrophoresis followed by Coomassie blue stain to determine the purity of the preparation and Western blot for the identity of protein. Enzymes were aliquoted and stored at -80C°.

Inhibition of EGFR and HER2 kinase autophosphorylation was measured by a DELFIA/time-resolved fluorometry assay. Compounds were dissolved in 100% DMSO and diluted to the appropriate concentrations with 25 mM HEPES, pH 7.4. In each well, 10  $\mu$ l of compound was incubated with 10  $\mu$ l of recombinant EGF-R or HER2 enzyme (1:80 dilution in 100 mM HEPES) for 10 min at room temperature. Then, 10  $\mu$ l of 5x buffer (containing 20 mM HEPES, 2 mM MnCl<sub>2</sub>, 100  $\mu$ M Na<sub>3</sub>VO<sub>4</sub> and 1mM DTT) and 20  $\mu$ l of 0.1 mM ATP/50 mM MgCl<sub>2</sub> was added for 1 h. Positive and negative controls were included in each plate by incubation of enzyme with or without ATP/MgCl<sub>2</sub>. At the end of incubation, liquid was aspirated and washed three times with wash buffer. 75  $\mu$ l (400 ng) of europium-labeled anti-phosphotyrosine antibody was added to each well for another hour of incubation. After wash, enhancement solution was added and the signal was detected by Victor (Wallac Inc) with excitation at the wavelength of 340 nm and emission at the wavelength of 615 nm. All reagents were supplied by Wallac Inc (Wallac/Perkin-Elimer). Percentage of autophosphorylation inhibition by compound was calculated by 100-[(test- negative control)/(positive control-negative control)]. IC<sub>50</sub> values were obtained from curves of

percentage inhibition with 8 doses of compound. The results of these determinations for the compounds of this invention are shown below in Table 1.

**INHIBITION OF CANCER CELL GROWTH**

- 10 Four human carcinoma cell lines, A431 (epidermoid carcinoma), SKBR3 (breast carcinoma), SW620 (colon carcinoma), and MDA-MB435 (breast carcinoma), BT474 (breast carcinoma), and two murine lines, 3T3 (murine fibroblasts) and HER2-3T3 (murine fibroblasts transfected with human HER2) were used for cell proliferation assays. Cells were maintained in RPMI-1640 medium supplemented with 5% fetal
- 15 bovine serum. Cells were plated in 96-well plates at the densities of  $2.5 \times 10^4$ /ml for 3T3 and 3T3/HER2 and  $5.0 \times 10^4$ /ml for the rest of the cell lines. On the next day, compounds were dosed at 0.5, 5, 50, 500, and 5000 ng/ml and cultured for 2 days. At the end of incubation, cell survival was determined by the sulforhodamine B assay as previously described (Skehan, P; Stornet, R.; Scudiero, D.; Monks, A.; McMahon, J.; Vistica D., Warren, J.; Bokbosch, H.; Kenny, S.; Boyd, M. obtained from the growth curves and are shown below in Table 2 where the results of multiple determinations are included.

**IN VIVO INHIBITION OF THE GROWTH OF MURINE 3T3 CELLS TRANSFECTED WITH HER2**

10

Representative compounds of this invention (listed below) were evaluated in an *in vivo* standard pharmacological test procedure which measures their ability to inhibit tumor growth in nude mice. Murine 3T3 fibroblasts, tranfected with Her2 were grown in vitro. Athymic nu/nu female mice (Charles River, Wilmington, MA) were

15 used in this *in vivo* standard pharmacological test procedure. A unit of  $2 \times 10^6$  cells

- was injected SC into mice (day zero). Beginning on day 1, mice were treated IP every other day for a total of 11 days with a dose of 30mg/kg/dose of the compound to be evaluated in 0.5% Methocel/0.4% Tween 80. Control animals received vehicle alone. Tumor mass was determined every 7 days  $[(\text{length} \times \text{width}^2)/2]$  for a period of 21 days. Absolute tumor growth in mgs, (mean tumor mass on days 7, 14 and 21), is calculated for each treatment group. Statistical analysis (Student t-test) of Mean Tumor Mass compares treated verses control groups. A p-value of  $\leq 0.05$  indicates a statistically significant reduction in tumor growth of treated group compared to the vehicle control.
- The compound of Example 7 was evaluated for its ability to inhibit the growth of a murine fibroblast tumor that was transfected with human HER2 *in vivo* using the standard pharmacological test procedure described above. The results obtained are shown in Table 3.

As shown in Table 3, the compound of Example 7 significantly inhibited tumor growth. At 30 mg/kg (administered i.p.) on day 14, the tumors in the control mice were on average 8.5 times larger than the tumors in the mice that were treated with the compound of Example 7.

5           Based on the results obtained for representative compounds of this invention, the compounds of this invention are antineoplastic agents which are useful in treating, inhibiting the growth of, or eradicating neoplasms. In particular, the compounds of this invention are useful in treating, inhibiting the growth of, or eradicating neoplasms that express EGFR such as those of the breast, kidney,  
10   bladder, mouth, larynx, esophagus, stomach, colon, ovary, or lung. In addition, the compounds of this invention are useful in treating, inhibiting the growth of, or eradicating neoplasms of the breast that express the receptor protein produced by the erbB2 (Her2) oncogene. Based on the results obtained, the compounds of this invention are also useful in the treatment of polycystic kidney disease.

15           The compounds of this invention may function *in vivo* as prodrugs. By the result of either a chemical reaction or metabolism, the compounds of this invention can be converted to other compounds that are useful for the treatment of cancer and polycystic kidney disease.

          The compounds of this invention may be formulated neat or may be  
20   combined with one or more pharmaceutically acceptable carriers for administration. For example, solvents, diluents and the like, and may be administered orally in such forms as tablets, capsules, dispersible powders, granules, or suspensions containing, for example, from about 0.05 to 5% of suspending agent, syrups containing, for example, from about 10 to 50% of sugar, and elixirs containing, for example, from  
25   about 20 to 50% ethanol, and the like, or parenterally in the form of sterile injectable solution or suspension containing from about 0.05 to 5% suspending agent in an isotonic medium. Such pharmaceutical preparations may contain, for example, from about 0.05 up to about 90% of the active ingredient in combination with the carrier, more usually between about 5% and 60% by weight.

30           The effective dosage of active ingredient employed may vary depending on the particular compound employed, the mode of administration and the severity of the condition being treated. However, in general, satisfactory results are obtained when the compounds of the invention are administered at a daily dosage of from

about 0.5 to about 1000 mg/kg of body weight, optionally given in divided doses two to four times a day, or in sustained release form. The total daily dosage is projected to be from about 1 to 1000 mg, preferably from about 2 to 500 mg. Dosage forms suitable for internal use comprise from about 0.5 to 1000 mg of the active compound in intimate admixture with a solid or liquid pharmaceutically acceptable carrier. This dosage regimen may be adjusted to provide the optimal therapeutic response. For example, several divided doses may be administered daily or the dose may be proportionally reduced as indicated by the exigencies of the therapeutic situation.

The compounds of this invention may be administered orally as well as by intravenous, intramuscular, or subcutaneous routes. Solid carriers include starch, lactose, dicalcium phosphate, microcrystalline cellulose, sucrose and kaolin, while liquid carriers include sterile water, polyethylene glycols, non-ionic surfactants and edible oils such as corn, peanut and sesame oils, as are appropriate to the nature of the active ingredient and the particular form of administration desired. Adjuvants customarily employed in the preparation of pharmaceutical compositions may be advantageously included, such as flavoring agents, coloring agents, preserving agents, and antioxidants, for example, vitamin E, ascorbic acid, BHT and BHA.

The preferred pharmaceutical compositions from the standpoint of ease of preparation and administration are solid compositions, particularly tablets and hard-filled or liquid-filled capsules. Oral administration of the compounds is preferred.

In some cases it may be desirable to administer the compounds directly to the airways in the form of an aerosol.

The compounds of this invention may also be administered parenterally or intraperitoneally. Solutions or suspensions of these active compounds as a free base or pharmacologically acceptable salt can be prepared in water suitably mixed with a surfactant such as hydroxy-propylcellulose. Dispersions can also be prepared in glycerol, liquid polyethylene glycols and mixtures thereof in oils. Under ordinary conditions of storage and use, these preparation contain a preservative to prevent the growth of microorganisms.

The pharmaceutical forms suitable for injectable use include sterile aqueous solutions or dispersions and sterile powders for the extemporaneous preparation of sterile injectable solutions or dispersions. In all cases, the form must be sterile and must be fluid to the extent that easy syringability exists. It must be stable under the

conditions of manufacture and storage and must be preserved against the  
contaminating action of microorganisms such as bacteria and fungi. The carrier can  
be a solvent or dispersion medium containing, for example, water, ethanol, polyol  
(e.g., glycerol, propylene glycol and liquid polyethylene glycol), suitable mixtures  
5 thereof, and vegetable oils.

For the treatment of cancer, the compounds of this invention can be  
administered in combination with other antitumor substances or with radiation  
therapy. These other substances or radiation treatments can be given at the same or  
at different times as the compounds of this invention. These combined therapies may  
10 effect synergy and result in improved efficacy. For example, the compounds of this  
invention can be used in combination with mitotic inhibitors such as taxol or  
vinblastine, alkylating agents such as cisplatin or cyclophosphamide, antimetabolites  
such as 5-fluorouracil or hydroxyurea, DNA intercalators such as adriamycin or  
bleomycin, topoisomerase inhibitors such as etoposide or camptothecin,  
15 antiangiogenic agents such as angiostatin, and antiestrogens such as tamoxifen.

The compounds of this invention and their preparation are illustrated by the  
following non-limiting examples.

# INTERNATIONAL SEARCH REPORT

International application No.  
PCT/US 02/37918

## Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☒ Claims Nos.:  
because they relate to subject matter not required to be searched by this Authority, namely:  
  
Although claims 26-29 are directed to a method of treatment of the human/animal body, the search has been carried out and based on the alleged effects of the compound/composition.
2. ☐ Claims Nos.:  
because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:
3. ☐ Claims Nos.:  
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

## Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

### Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
- ☐ No protest accompanied the payment of additional search fees.
